1. Version history

| Date | Changes |
|------------------|---|
| October 16, 2006 | Initial release |
| November 8, 2006 | Parameter DATEFORMAT added and DATE description updated |

2. Conventions

The key words "MUST", "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" in this document are to be interpreted as described in [RFC 2119](#).

3. Introduction

This document is intended for developers who are responsible for the implementation of the HTTP connection with the SMS/MMS gateway of Wireless Services.

In chapter 4 a description is given of the Application Programming Interface (API) which is available for several programming languages. Chapter 5 contains the necessary information for connecting to the gateway. All available HTTP request parameters are discussed in detail in chapter 6. The gateway response is explained in chapter 7, followed by an example HTTP request and response in chapter 8.

4. Application Programming Interface (API)

Wireless Services has developed an Application Programming Interface (API) which can be easily integrated into other applications. Clients are strongly encouraged to use this API when implementing the HTTP interface for a supported programming language (see table 4.1).

The advantages of using the API are:

- Easy integration into client applications
- Highly reliable due to redundant gateways
- New features will be added when available
- Easy upgradable
- Outbound and Inbound functionality
- IP-based security checks for inbound messages
- SHA1 encryption for authentication

The currently supported API functionalities are:

SMS Outbound

- Text SMS
- Premium SMS
- Binary SMS
- Picture SMS
- EMS
- Monophonic ringtones
- WAP Push
- OMA Client Provisioning
- vCalendar
- vCard

SMS Inbound

SMS Delivery Notifications

MMS Outbound

Clients can easily upgrade to the latest version as newer versions are backwards compatible. The API can be downloaded from the [Support Center](#) on our website and is available for the programming languages listed in the table below.

| Programming language | Current version |
|----------------------|-----------------|
| Perl 5 | 2.4 |
| PHP 4 + PHP 5 | 2.42 |

Table 4.1 – API programming languages

Please refer to the documentation and examples included with the API for more information.

5. Gateway connection

Clients can connect to the SMS/MMS gateway using either HTTP or HTTPS. Both GET and POST requests are supported, but POST requests are recommended because of limitations in the length of GET requests. The connection details for using the interface described in this document are listed in the table 5.1. The port number for connecting to the gateway is port 80 for HTTP and port 443 for HTTPS.

| Gateway | URL | HTTPS |
|------------------|---|-------|
| Main (preferred) | http://gateway.wireless-services.nl/sendpsms | Yes |
| Backup | http://gateway2.wireless-services.nl/sendpsms | No |

Table 5.1 – Connection details for HTTP

5.1 Main and backup gateway

The main gateway is the recommended gateway to use for all clients. The backup gateway should be used as a failover server. It is strongly advised to implement application logic to automatically switch to the backup gateway in case the main gateway is unreachable due to Internet connectivity issues.

5.2 Content-Type header

In case of POST requests, the Content-Type header **MUST** have the following value:

`application/x-www-form-urlencoded`

5.3 Host header

Clients **MUST** use the Host header in all HTTP requests to the gateway. The Host header specifies the Internet host of the resource being requested and equals the host portion of the URL (e.g. *gateway.wireless-services.nl* for the main gateway). Please refer to chapter 8 for an example request with Host header.

6. Request parameters

In this chapter all available request parameters will be discussed. The parameter names are case-sensitive. They MUST be written in uppercase letters and all values MUST be properly URL escaped.

The following parameters are defined:

| Parameter | Mandatory | Description | Paragraph |
|------------|-----------|----------------------------------|-----------|
| VERSION | Yes | Interface version | 6.1 |
| UID | Yes | Username of the client's account | 6.2 |
| PWD | Yes | Password | 6.3 |
| AUTHTYPE | No | Authentication type | 6.4 |
| AUHTIME | No | Authentication timestamp | 6.5 |
| N | Yes | Recipient numbers | 6.6 |
| M | Yes | Message body | 6.7 |
| RATE | Yes | End-user price | 6.8 |
| OPR | No | Recipient operator code | 6.9 |
| SESSIONID | No | Session identifier | 6.10 |
| O | No | Originator | 6.11 |
| ONUM | No | Numeric originator | 6.12 |
| TEST | No | Test request | 6.13 |
| DATE | No | Scheduled delivery | 6.14 |
| DATEFORMAT | No | Scheduled delivery date format | 6.15 |

| | | | |
|---------|----|---|------|
| NOT | No | Notification request | 6.16 |
| NOTTYPE | No | Notification type | 6.17 |
| BATCHID | No | Batch identifier | 6.18 |
| MSGID | No | Message identifier for logging purposes | 6.19 |
| VAL | No | Validity | 6.20 |

Table 6.1 – HTTP request parameters

Each parameter is described in the next paragraphs.

6.1 Version (VERSION)

The version parameter specifies the interface version the client is using. The current version number described in this document is **1.1**. Clients **MUST** specify this version number as the value of the parameter.

| | |
|----------------------|-----------|
| Default value | 1.0 |
| Value range | 1.0 – 1.1 |

Parameter properties

6.2 Username (UID)

To authenticate the client, the username of the client’s account must be specified. The account details are sent to the client by our Support department.

It is also possible to use a predefined whitelist of IP numbers/ranges from which the client is allowed to connect. By default, the client can connect from any IP number. The IP whitelist can be enabled by contacting our Support department.

6.3 Password (PWD)

To authenticate the client a password must be supplied. The value of this parameter depends on the used encryption mechanism (see 6.4).

6.4 Authentication type (AUTHTYPE)

The client can choose several encryption mechanisms for authentication. When **plaintext** (default) is used, the client's password is transmitted as normal text in the *PWD* parameter.

To provide a higher level of security and prevent the password from being visible in the request, the encryption mechanisms **md5** and **sha1** can be used. The input for these encryption functions is the client's account password and the current timestamp, *AUTHTIME* (see 6.5). The output is a 32-character hexadecimal string for MD5 or a 40-character hexadecimal string for SHA1. The computation of the *PWD* parameter is as follows:

PWD = MD5(<password><timestamp>)
PWD = SHA1(<password><timestamp>)

Example:

password=as4bY3
timestamp=1160989330

MD5=7b04fa4523a238b89af4ad63acaa3b00
SHA1=b0d94617b5c49c0284e5983cbfb4355ac64eb654

Many programming languages have built-in functions for MD5 and SHA1 encryption. For more information about these encryption mechanisms, please see [RFC1321](#) (MD5) and [RFC3174](#) (SHA1).

| | |
|---------------|------------------------|
| Default value | plaintext |
| Value range | plaintext / md5 / sha1 |

Parameter properties

6.5 Authentication timestamp (AUTHTIME)

When the client uses MD5 or SHA1 authentication, the gateway needs to verify the calculated value in the *PWD* parameter with the client's password stored in the database. Therefore, the value of the timestamp used by the client to calculate this

value **MUST** be transmitted in the *AUTHTIME* parameter. The gateway will perform the same calculation as the client and rejects the request if the results do not match.

The timestamp is specified as a UNIX timestamp, which is the number of elapsed seconds since January 1st, 1970 00:00:00. It is important to note that the gateway will reject requests if the timestamp provided is more than 12 hours earlier or later than the current timestamp. This means that if the internal clock of the client's server is off by more than 12 hours, the request will be rejected.

| | |
|----------------------|----------------------------|
| Default value | None |
| Value range | 12 hours from current time |

Parameter properties

6.6 Recipient numbers (N)

The recipient parameter is a comma-separated list of mobile numbers to receive the message. The mobile numbers should be in international format (e.g. +447123456789) with or without leading + sign. The only exceptions to this rule are Dutch mobile numbers. These can also be specified in national format (e.g. 0612345678) and are automatically converted to international format by the gateway.

6.7 Message body (M)

This parameter contains the body of the message. The maximum length for text messages is 160 characters. Longer messages will be truncated.

6.8 End-user price (RATE)

The end-user price of the message is specified in cents. So if the client wishes to send a message with a tariff of EUR 0.70, the value of this parameter must be set to **70**. Contact your account manager for a list of available/enabled end-user prices. If the client specifies a value of **0** (default), the message will not be charged to the end-user.

| | |
|----------------------|---------|
| Default value | 0 |
| Value range | 0 – 500 |

Parameter properties

6.9 Operator code (OPR)

For Premium SMS outside the Netherlands the client MUST specify the destination operator code for the specified recipients. The defined operator codes are supplied by Wireless Services when Premium SMS is activated for your account.

Please note that when the client specifies an incorrect or invalid operator code the end-users cannot be charged and the client will not receive the kickback for these messages.

6.10 Session identifier (SESSIONID)

Some operators include a session identifier with each Mobile Originated (MO) message. When the client is sending back a Premium SMS message as a response to an MO message which includes this parameter, they MUST specify the same SESSIONID value. If omitted, the end-user cannot be charged and the client will not receive the kickback for these messages.

6.11 Originator (O)

The originator of the SMS message can be a numeric or alphanumeric string which will be displayed by the handset as the sender of the message. In case of a numeric originator, the maximum length is 16 digits. Alphanumeric originators have a maximum length of 11 characters.

| | |
|-----------------------|----------------------------|
| Default value | Account default |
| Maximum length | 11 characters or 16 digits |

Parameter properties

6.12 Numeric originator (ONUM)

In case the originator is numeric, this parameter specifies whether the number is an international number or national shortcode. International numbers are displayed on the handset with a leading + character. If the client specifies a national shortcode as originator, this parameter should be given a value of 1.

| | |
|----------------------|--------------------------|
| Default value | 0 (international number) |
| Value range | 0 – 1 |

Parameter properties

6.13 Test request (TEST)

For testing purposes, this parameter can be used to simulate a request. In test mode, the gateway verifies all parameters but does not send any SMS messages. The gateway will return the same response in test mode as in normal mode.

Clients MUST NOT use this parameter to send large volumes of test requests.

| | |
|----------------------|-------|
| Default value | 0 |
| Value range | 0 – 1 |

Parameter properties

6.14 Scheduled delivery (DATE)

Messages can be scheduled for delivery at a future date/time. The parameter value depends on the value of the DATEFORMAT parameter (see 6.13). The gateway will queue the scheduled messages and delivers them at the specified timestamp.

| | |
|----------------------|---|
| Default value | Immediate delivery |
| Examples | cet: 2007-02-20 09:15:00 relative: 30 unix: 1162983334 |

Parameter properties

6.15 Scheduled delivery date format (DATEFORMAT)

The scheduled delivery timestamp (see 6.14) can be specified in different formats. The default value is **cet**, where the timestamp is specified as YYYY-MM-DD HH:MM:SS and indicates a timestamp in Central European Time format. The value **relative** means the timestamp is specified in seconds from the time the message is delivered to the gateway, whereas the value **unix** means the timestamp is specified in UNIX seconds since Jan 1st, 1970 at 00:00.

| | |
|----------------------|-----------------------|
| Default value | cet |
| Value range | cet / relative / unix |

Parameter properties

6.16 Notification request (NOT)

For each sent SMS message the client can request a delivery notification. Delivery notifications are used to track the status of an SMS message. Each received notification will be automatically forwarded to the client via HTTP, SMTP, UCP, SMPP, CIMD2 or TCP. Notifications are enabled upon request only because of the necessary configuration details for the delivery to the client's system.

| | |
|----------------------|-------|
| Default value | 0 |
| Value range | 0 – 1 |

Parameter properties

6.17 Notification type (NOTTYPE)

When notifications are requested, this parameter defines which types of notifications are forwarded to the client. The following values can be specified:

| Value | Type | Description |
|-------|-------------|---|
| 1 | Accepted | Message accepted by destination SMSC |
| 2 | Buffered | Message buffered in destination SMSC for later delivery |
| 4 | Delivered | Message successfully delivered on the handset |
| 8 | Undelivered | Message could not be delivered to the handset |

Table 6.2 - Description of the NOTTYPE values

A combination of values is also possible. If the client wants to request buffered and delivered notifications, a value of 6 should be specified. This is the sum of the buffered and delivered value.

| | |
|----------------------|------------------------------|
| Default value | 12 (delivered + undelivered) |
| Value range | 1 – 15 |

Parameter properties

6.18 Batch identifier (BATCHID)

Client can use a unique batch identifier to prevent duplicate deliveries of the same message. Certain network conditions can trigger a timeout when waiting for the gateway response while the message is already processed and sent by the gateway. If the client's application will retry the same request again, the message will be delivered multiple times to the specified recipient(s). When using a batch identifier, the gateway will check if the identifier has been used before. If so, the request will be rejected and no messages will be sent.

| | |
|-----------------------|---------------|
| Default value | None |
| Maximum length | 50 characters |

Parameter properties

6.19 Message identifier (MSGID)

The message identifier is used for logging purposes and reporting. Clients can use message identifiers to separate different applications or customers in reports.

| | |
|-----------------------|---------------|
| Default value | None |
| Maximum length | 32 characters |

Parameter properties

6.20 Validity (VAL)

The validity parameter, specified in seconds, determines how long an SMS message will be stored in the SMSC if the message cannot be delivered immediately (e.g. phone switched off). The SMSC will try to deliver the message using an operator defined retry scheme. After the specified validity period the SMSC will automatically delete the message from the queue and delivery to the handset will not take place.

| | |
|----------------------|-----------------|
| Default value | 172800 (2 days) |
| Value range | 120 – 604800 |

Parameter properties

7. Gateway response

Each HTTP request from the client will be answered with an HTTP response. This response will contain standard HTTP headers and a response body. The content type of the response is **text/plain**. The format of the response body is as follows:

```
[3-digit result code]=[additional information]
```

The possible result codes and their general meaning are as follows:

| Result code | General meaning |
|-------------|--|
| 0XX | Successful request, a total of XX SMS messages per recipient were sent |
| 100 – 199 | Rejected request |
| 200 | Internal error |

Table 7.1 – Overview of result codes

7.1 Successful request (0XX)

If the request is successful, the gateway will return the amount of SMS messages sent per recipient. The additional information contains a unique identifier for this request. Clients can specify their own unique identifier by using the *BATCHID* parameter (see 6.18). If omitted, the gateway will generate a unique identifier of 16 digits. When the client requests delivery notifications (see 6.16), each generated notification will also contain the same identifier enabling clients to link the notification to the original request.

7.2 Rejected request (100 – 199)

A request can be rejected if parameters are either missing or invalid or if account settings do not permit the client to send messages. Rejected requests **MUST NOT** be retried by the client system, for as the same request will lead to the same result.

The additional information will contain a textual description of the error. For an overview of all rejected result codes and their description, please refer to Appendix A.

7.3 Internal error (200)

Internal errors are very rare and can occur in case of database connectivity problems. When a client receives an internal error, they SHOULD retry the same request after an interval of approximately 5 seconds to prevent flooding the server with requests.

8. Example request / response

Below is an example HTTP request for sending the message *Test Premium Message!* with an end-user of EUR 0.70 to two recipients *+31611111111* and *+31622222222*. The originator of the message is *My Service*. Please note the URL encoded characters in the N, M and O parameters.

```
POST /sendpsms HTTP/1.0\r\n
Host: gateway.wireless-services.nl\r\n
Content-Type: application/x-www-form-urlencoded\r\n
Content-Length: 112\r\n
Connection: close\r\n
\r\n
VERSION=1.1&UID=username&PWD=password&N=31611111111%2C31622
22222&M=Test+Premium+Message%21&O=My+Service&RATE=70
```

The gateway will respond with the following HTTP response:

```
HTTP/1.1 200 OK\r\n
Date: Fri, 13 Oct 2006 16:05:38 GMT\r\n
Server: Apache\r\n
X-Gateway: Wireless Services\r\n
X-Gateway-URL: gateway.wireless-services.nl\r\n
Connection: close\r\n
Content-Type: text/plain\r\n
\r\n
001=1160938726272031
```

The result code is 001, indicating that the request was successful and that a total of 1 SMS message per recipient was sent. The unique identifier for this request is 1160938726272031.

9. Contact details

For more information about this specification, please contact our Support department.

Wireless Services B.V.
Newtonlaan 115
3584 BH Utrecht, The Netherlands

Telephone: +31 (0) 30 – 210 6499
Fax: +31 (0) 30 – 210 6666
E-mail: support@wireless-services.nl

11. Appendix A: Result codes

Table 11.1 lists all possible result codes which can be returned by the gateway, including the message types they are applicable to.

| Result code | Message types | Description |
|-------------|---------------|--|
| OXX | SMS/MMS | OK, message accepted |
| 100 | SMS/MMS | Invalid interface version |
| 101 | SMS/MMS | Authentication failed |
| 102 | SMS/MMS | Invalid password format |
| 103 | SMS/MMS | Invalid authentication timestamp |
| 104 | SMS/MMS | Invalid authentication type |
| 105 | SMS/MMS | IP address not in whitelist |
| 106 | SMS/MMS | Blocked account, please contact support@wireless-services.nl |
| 107 | SMS | Notifications not allowed for this account |
| 108 | SMS | SMS Outbound not allowed for this account |
| 109 | SMS | SMS Outbound Premium not allowed for this account |
| 110 | MMS | MMS Outbound not allowed for this account |
| 111 | SMS/MMS | Duplicate batch identifier |
| 112 | SMS/MMS | No destination number(s) specified |
| 113 | SMS/MMS | Invalid destination numbers |
| 114 | SMS/MMS | Invalid group name |

| | | |
|-----|---------|----------------------------------|
| 115 | SMS/MMS | Insufficient SMS credits left |
| 116 | SMS | Alphanumeric originator too long |
| 117 | SMS | Numeric originator too long |
| 118 | SMS | Invalid validity |
| 119 | SMS | Validity out of range |
| 120 | SMS | Invalid data coding scheme |
| 121 | SMS | Invalid message class |
